Nazewnictwo alkenów ; alkinów

3-metylowykloheks-1-en

buta-1,3-dien

"wiązania pojedyncze (σ) mogą się swobodnie obracać"

wiązania π się nie mogą obrócić

cis

trans

izomery geometryczne
(stereoisomery)

cis

Czy dany układ tworzy izomery cis-trans?

nie tworzy izomerów cis-trans

c)

cis - 3 - methylpent - 2 - en

Związek może mieć izomery cis-trans, gdy:

1) jest podwójne wiązanie $C=C$

2) przy każdym z tych atomów węgla są dwa różne podst.

Enancjomery

Chiralność - odbicie lustrzane nie jest identyczne z danym obiektem

Chiralne węzły $\rightarrow$ musimy znaleźć atom węgla, który ma 4 różne podstawniki
